

On-Page and Off Page Optimization

Dipti Pawade

On –Page Optimization - Keyword Planning

- Your **SEO keywords** are the key words and phrases in your web content that make it possible for people to find your site via search engines.
- you need to know how people are looking for the products, services or information that you offer, in order to make it easy for them to find you—otherwise, they'll land on one of the many other pages in the Google results.
- Implementing keyword SEO will help your site rank above your competitors.

On –Page Optimization - Keyword Planning

- 1) Getting started with a brainstorm list
- 2) Selecting and Using a Keyword Research Tool
- 3) Refining your list using suggested keyword phrases from an analysis tool
- 4) Verifying keyword phrase relevance
- 5) Looking at search volume to determine consumer demand
- 6) Analyzing the competitive space to make sure you and the searcher think the keywords mean the same things, and to decide if the space is too competitive

On-Page Ranking Factors

- Many on-page ranking factors are related to the use of keywords while some other factors are not directly related to keywords.

On-Page Ranking Factors

- **Keywords in the <title> Tag**
- **Keywords in the Page URL**
- **Keywords in the Page Copy**
- **Keywords in the <meta> Description Tag**
- **Keywords in the Heading Tags**
- **Keyword Proximity**
- **Keyword Prominence**
- **Keywords in the Link Anchor Text**
- **Quality Outbound Links**
- **Web Page Age**
- **Web Page Size**

Esearch engines like Google show meta tags in their search results. You perform a search task by filling out:

(A) certain keywords. The results you will get is

(B) the [title tag](#) and

(C) the small text item, the [description tag](#).

Meta Tag: Description

- Description is meta tag that you add at the top of the web page, inside the `<head>` tag.
- The Description meta tag provides a brief summary of the webpage and its content.
- Search crawlers use this tag to get information about the page content and display it in the search results.
- Unlike with the Title tag, you can use a greater number of characters to describe your website.
- Make sure to use optimized keywords that represent the website content.

Meta Tag: Description

- Here is the format of a <meta> description tag:

<meta name="description" content="Optimized Description with Important Keywords. This text can be a short paragraph. Use important page copy keywords in this description.">

Ex:

<meta name="description" content="**O'Reilly Media spreads the knowledge of technology innovators through its books,** online services, magazines, and conferences. Since 1978, O'Reilly has been a chronicler and catalyst of leading-edge development, homing in on the technology trends that really matter and spurring their adoption by amplifying'faint signals' from the alpha geeks who are creating the future." />

Meta Tag: Description

The image shows a Google search interface with the query 'hats'. Below the search bar, the 'Web' tab is selected. The search results show 'About 286,000,000 results (0.44 seconds)'. The first result is from 'LIDS Hats and Caps' with the URL 'www.lids.com/'. The second result is from 'hats.com' with a detailed description of their offerings. Annotations in red text and arrows point to specific parts of the search results: 'Title Tag' points to the link 'LIDS Hats and Caps'; 'URL in search' points to the URL 'www.lids.com/'; and 'Meta Description' points to the descriptive paragraph of the second result.

Meta Tag: Keyword

- The Keyword meta tag includes individual keywords separated by commas.
- Search engine crawlers use the Keyword meta tag information to index the website and display it in the search results.
- The keywords should be descriptive and optimized to ensure that the search engine displays the website when users search for these specific keywords.
- **`<meta name="keywords" content="Keyword1, Keyword2, Keyword3">`**

Meta Tag: Keyword

- It's very important that you add the keywords you want your site to be found under in your KEYWORD tag.
- If a search engine spider finds the same words on your website and in your meta tags, these words will be ranked higher in the search index.
- Don't add too many words, the most search engines will only index the first 20 words. Make sure that you put the 10 most important keywords first.

Meta Tag: Keyword

- Limit your number of keywords to around 2 to 5 percent of your content. Overloading your web page with keywords is considered stuffing, and it may negatively affect your Google rank.
- Some search engines overlook the Keyword tag, but it is still useful in others.

Meta Tag: Author

- The Author meta tag includes information about the web page's creator, or webmaster, as well as contact information, an e-mail, and the company name.
- Some people use separate tag 'contact' to give contact details.
- It is not important as description, title or keyword tag.

Meta Tag: Author

- `<meta name="author" content="text">`

Ex: `<meta name="author" content="John Smith">`

- Contact tag

`<meta name="contact" content="email@address">`

- Copyright tag

`<meta name="copyright" content="name of owner">`

Country

- <META NAME="geo.position" CONTENT="[latitude](#); [longitude](#)">
<META NAME="geo.placename" CONTENT="[Place Name](#)">
<META NAME="geo.region" CONTENT="[Country Subdivision Code](#)">
- <META NAME="geo.position" CONTENT="49.2;-123.4">
<META NAME="geo.placename" CONTENT="London">
<META NAME="geo.region" CONTENT="CA-ON">

Country

- Geo tags are generally used if your website/business is location specific.
- A restaurant would be a good example of this as it has a physical location relevant to the services it is offering.
- The tag Placed on each page of the website, these let the search engines know where you're based and could help improve your search engine rankings for local related search terms.

Meta tag: robots

- It explain to a spider of a search engine you only want it to index just the first page of your website or that it is allowed to index the whole website.
- You use a specific HTML meta tag the so called the meta robots tag.

```
<meta name="robots" content="selection">
```

Meta tag: robots

- `<meta name="robots" content="index, follow">`
 - The spider will now index your whole website.
 - The spider will not only index the first web-page of your website but also follow outbound links

Meta tag: robots

```
<meta name="robots" content="index, nofollow">
```

The spider will now only look at this page and stops there.

```
<meta name="robots" content="noindex, follow">
```

The spider will not look at this page but will crawl through the rest of the pages on your website.

```
<meta name="robots" content="noindex, nofollow">
```

The spider will not look at this page and will NOT crawl through the rest of your web-pages.

Meta tag: robots

- <!-- Tells Yahoo! to not use Yahoo! Directory description -->
 <meta name="robots" content="noydir" />
- <!-- Tells search engines to not use ODP (Open Directory Project.) description -->
 <meta name="robots" content="noodp" />
- <!-- Tells search engines to not use either of the two directories -->
 <meta name="robots" content="noodp,noydir" />

Meta tag: robots

- `<meta name="googlebot" content="noodp">`
- `<!-- Note: Only Yahoo! uses Yahoo! Directory -->`
- `<meta name="slurp" CONTENT="noydir">`
 - `<meta name="msnbot" CONTENT="noodp">`

Directive	Description
Noindex	Instructs search engines <i>not</i> to index this page. Example: <pre><meta name="robots" content="noindex" /></pre>
Nofollow	Instructs search engines <i>not</i> to follow or drain any link juice for any outbound links. Example for all spiders: <pre><meta name="robots" content="nofollow" /></pre>
Nosnippet	Instructs search engines <i>not</i> to show any search results for this page. Example: <pre><meta name="robots" content="nosnippet" /></pre>
Noarchive	Instructs search engines <i>not</i> to show a cache link for this page. Example: <pre><meta name="robots" content="noarchive" /></pre>
Noodp	Instructs search engines <i>not</i> to use Open Directory Project descriptions in the SERPs. Example: <pre><meta name="robots" content="noodp" /></pre>
Follow	Default implied directive that says “follow” all outbound links. Example: <pre><meta name="robots" content="follow" /></pre>
Index	Default implied directive that says “index” this page. Example:

Meta tag for redirection (**HTTP-EQUIV "REFRESH"**)

- By using **HTTP-EQUIV "REFRESH"** tag you are able to define after how long a page has to be refreshed or after a certain period of seconds you want your visitor to be redirected to another webpage.
- Search engines usually don't like it when you use refresh pages. A better solution is to add a click-able link.
- It can influence your ranking in a negative way by using this tag the wrong way!

Meta tag for redirection (**HTTP-EQUIV "REFRESH"**)

- `<meta http-equiv="refresh" content="value">`

- Ex

`www.yourevent.com/2011registration.html`

`www.yourevent.com/2012registration.html`

- Whenever page number 1 isn't active anymore you replace it with a new page adding the text 2011 closed, but register yourself now for 2012. Now you add a refresh tag so your visitor will be redirected immediately to the next page.

```
<meta http-equiv="refresh" content="10;  
,URL=/2012registration.html">
```

"10" is the number of seconds it takes to go from the

Meta tag for redirection (**HTTP-EQUIV "REFRESH"**)

- Told the page to refresh after 30 sec

```
<meta http-equiv="refresh" content="30">
```

Heading Tag

- The $H(x)$ tags in HTML ($H1$, $H2$, $H3$, etc.) are designed to indicate a headline hierarchy in a document.
- Thus, an $H1$ tag might be considered the headline of the page as a whole, whereas $H2$ tags would serve as subheadings, $H3$ s as tertiary-level headlines, and so forth.

Heading Tag

- Search engines recognize the copy in your header tags as more important than the rest.
- This starts with your h1 and works its way down in importance to the h2, h3 and so on.
- The h1 tag should contain your targeted keywords, ones that closely relate to the page title and are relevant to your content.
- The h2 tag is a subheading and should contain similar keywords to your h1 tag.
- Your h3 is then a subheading for your h2 and so on.
- Think of them as a hierarchy based on importance, the above being more important than the below.

Heading Tag

- Keep in mind that it's also very important that your header tags are readable and grammatically correct.
- Stuffing your h1, h2 and h3 with keywords is not going to help your cause.
- If anything, Google will recognize this and assume you are trying to manipulate them.

Anchor Text

- Anchor text is the visible characters and words that hyperlinks display when linking to another document or location on the web.

HTML Anchor Tag

Hypertext Reference

URL/Address

Title or description of the link destination

```
<a href = "http://example.com/" title = "Tutorial on  
Improving Your SEO Ranking.">SEO article</a>
```

Anchor Text

Closing Anchor HTML Tag

Anchor Text

- Search engines use external anchor text (text other pages use to link to your site) as a reflection of how other people view your page - and by extension, what your pages may be about. While website owners typically can't control how other sites link to theirs, “you can make sure that anchor text you use within your own site is useful, descriptive, and relevant.”

Anchor Text

Types of anchor text

- **Exact-match**

Anchor text is "exact match" if it includes a keyword that mirrors the page that is being linked to. For example: 'link building' linking to a page about link building.

- **Partial-match**

Anchor text that includes a variation of the keyword on the linked-to page. For example: 'link building strategies' linking to a page about link building.

- **Branded**

A brand name used as anchor text. For example: 'Moz' linking to an article on the Moz Blog.

- **Naked link**

A URL that is used as an anchor 'www.moz.com' is a naked link anchor.

Anchor Text

Types of anchor text

- **Generic**

A generic word or phrase that is used as the anchor. "Click here" is a common generic anchor.

- **Images**

Whenever an image is linked, Google will use the text contained in the image's alt attribute as the anchor text.

- **SEO-friendly anchor text is:**

- Succinct
- Relevant to the linked-to page
- Low keyword density (not overly keyword-heavy)
- Not generic

Link Title

- link TITLE is supposed to provide additional / advisory information about the link(expand on the meaning of the link).
- The anchor text is supposed to “name” the link, while the title text provides information about where the link will send the user. (especially with “click here” and “more” anchor text).

- `<a href="/ann-smarty/" title="Author's biography">Ann Smarty</a>`

OR

- `<a href="/ann-smarty/" title="More posts by Ann Smarty">Ann Smarty</a>`

Link Title

everything themselves. The Web is built on linking, and the Internet is ... well ... a network. **Other sites handle services that you don't want to do yourself.** Two examples that are already in place are outsourcing the acceptance of [credit payments](#) and having a [discussion forum hosted on another site](#). Currently, most large websites install their own search engines but it would be easier to handle search through a link to an external search engine that was configured to display the search results in the desired look and format. [Cnet article on discussion groups (and outsourcing of same)]

As another example, all corporate websites need to give visitors directions to headquarters and other company facilities. There is no need for every site to design its own maps since there are sites that specialize in mapping services. Instead, give directions through an appropriate link to a preferred mapping service. Many of these services even provide customized directions from the individual user's starting point to the desired destination. The mapping service is paid in whatever way it otherwise got paid. Currently, this means advertising, but in the

Example of a Link Title in Windows

Websites will realize that they do not need to do everything themselves. The Web is built on linking, and the Internet is ... well ... a network. These technologies are a perfect match for **letting other sites handle services that you don't want to do yourself.** Two examples that are already in place are outsourcing the acceptance of [credit payments](#) and having a [discussion forum hosted on another site](#). Currently, most large websites install their own search engines but it would be easier to handle search through a link to an external search engine that was maintained by experts but could still be configured to display the search results in the desired look and format. [Cnet article on discussion groups (and outsourcing of same)]

As another example, all corporate websites need to give visitors directions to headquarters and other company facilities. There is no need for every site to design its own maps since there are sites that specialize in mapping services. Instead, give directions through an appropriate link to a preferred mapping service. Example of a Link Title on a Macintosh

Link Title

- title attribute carries **no weight** on search engines (per my experience and based on other SEO's opinion).
- **Link TITLE attribute for usability:** in most browsers it will **pop up** when you hover over the link.

Link Title

- use it for your users, not search engines (this approach always pays back);
- don't duplicate it with link text (this hurts usability: for example some blind users will hear the same text twice);
- don't put too much weight on the title attributes as not all screen readers may render it (make sure either surrounding text or anchor text explains the link at least the first time you use it).

Robot.txt

- Using *robots.txt* is the original way to tell crawlers what not to crawl.
- *This method* is particularly helpful when you do not want search engines to crawl certain portions or all portions of your website.
- The *robots.txt* file is composed of a set of directives preceded by specific user-agent heading lines signifying the start of directives for a particular crawler.

Robot.txt

- The following is an example *robots.txt* file that instructs three different crawlers:

1 User-agent: *

2 Disallow: /

3 Allow: /blog/

4 Allow: /news/

5 Allow: /private

6

7 User-agent: msnbot

8 Disallow:

9

10 User-agent: googlebot

11 Disallow: /cgi-bin/

Robot.txt

- If Yahoo!'s Slurp paid a visit to this site, it would honor the first five lines of *robots.txt*— as it does not have its own custom entry within this *robots.txt* file.
- *This example has* several interesting scenarios. For instance, what would Slurp do if it had the following URLs to process?
- *http://mydomain.com/blog*
- *http://mydomain.com/blog/*
- Which URL would it crawl? The answer would be the second URL, as it fully matches the Allow directive on line 3 of the preceding code. The trailing slash signifies a directory,
- whereas the absence of the trailing slash signifies a file.

Robots.txt Directives

- **The Allow directive**
- The Allow directive tells web crawlers that the specified resources can be crawled.
- When multiple directives are applicable to the same URL, the longest expression takes precedence.
- Suppose we had a *robots.txt* file as follows:
 - 1 User-agent: *
 - 2 Disallow: /private/
 - 3 Allow: /private/abc/

Robots.txt Directives

The Disallow directive

- The Disallow directive was the original directive created.
- It signified the webmaster's desire to prohibit web crawler(s) from crawling specified directories or files.
- Its basic format is:
 - Disallow: /directory/
 - Disallow: /file.ext
- Consider the following code fragment:
 1. User-agent: *
 2. Disallow:
- In this case, all documents would be allowed for crawling.

Robots.txt Directives

The Disallow directive

- Another example:
 1. User-agent: *
 2. Disallow: /
- In this case, everything would be disallowed for crawling.
- The forward slash (Disallow) argument signifies the web root of your site.

The wildcard directives

- Two wildcards are used in *robots.txt*: \$ and *.
- Use the dollar sign wildcard (\$) when you need to match everything from the end of the URL.
- Use the star wildcard character (*) to match zero or more characters in a sequence.

```
1 User-agent: *
2 Disallow: *.gif$
3
4 User-Agent: Googlebot-Image
5 Disallow: *.jpg$
6
7 User-Agent: googlebot
8 Disallow: /sessionid
```

The Sitemap location directive

- The Sitemap location directive simply tells the crawler where your Sitemap can be found.
- Here is an example of the *robots.txt* file utilizing the Sitemap directive:

```
Sitemap: http://mydomain.com/sitemap.xml
```

```
User-Agent: *
```

```
Disallow:
```

The Sitemap location directive

- The Sitemap location directive simply tells the crawler where your Sitemap can be found.
- Here is an example of the *robots.txt* file utilizing the Sitemap directive:

```
Sitemap: http://mydomain.com/sitemap.xml
```

```
User-Agent: *
```

```
Disallow:
```

- The location of the Sitemap directive is not mandated. It can be anywhere within the robots.txt file.

The Crawl-delay directive

```
Sitemap: /sitemap.xml
```

```
User-agent: *
```

```
Disallow: /private/
```

```
User-agent: Slurp
```

```
Disallow:
```

```
Crawl-delay: 0.5
```

```
User-agent: MSNBot
```

```
Disallow:
```

```
Crawl-delay: 15
```

Directive (support)	Description
Allow	Instructs crawlers to crawl a specific page (or resource). Example: Allow: /cgi-bin/report.cgi This code instructs crawlers to crawl the <i>report.cgi</i> file.
Disallow	Instructs crawlers <i>not</i> to crawl all or parts of your site. The only exception to the rule is the <i>robots.txt</i> file. Example: Disallow: /cgi-bin/ This code prohibits crawlers from crawling your <i>cgi-bin</i> folder.
Sitemap	Instructs crawlers where to find your Sitemap file. Example: Sitemap: http://domain.com/sitemap.xml Hint: use absolute paths for cross search engine compatibility. Multiple Sitemap directives are allowed.
\$ wildcard	Instructs crawlers to match everything starting from the end of the URL. Example: Disallow: /*.pdf\$ This code prohibits crawlers from crawling PDF files.
* wildcard	Instructs crawlers to match zero or more characters. Example: Disallow: /search?* All URLs matching the portion of the string preceding the wildcard character will be crawled.
Crawl-delay	Directive specific to MSNBot and Slurp specifying a search engine–specific delay. Example: Crawl-delay: 5

External Ranking Factors- External Links

- External links are also known as backlinks, inbound links, and referral links.
- Backlinks (or back-links (UK)) are incoming links to a website or web page.
- In the search engine optimization (SEO) world, the number of backlinks is one indication of the popularity or importance of that website or page

Know Your Referrers

- Google's link: command: (link:yourdomain.com)
- Webmaster Tools

Quantity and Quality of External Links

- **Speed of backlink accumulation**
 - How fast are you accumulating backlinks?
 - backlinks using the same anchor text are suspicious

- **Topical link relevance**
 - the referring sites should also be talking about the same subject matter.
- **Backlinks from expert sites**
- **Backlinks from .edu and .gov domains**
- **Backlinks from directories**
- **Age of backlinks:** old is better
- **Relative page position:** closer to the top of an HTML page is better as compare to down the
- **Spilling PageRank effect :**The greater the number of other links found on the same page, the less of a benefit you will incur.
- **Relative popularity among peer sites**

Broken Outbound Links

- Many broken links on a site could be interpreted in the wrong way.
- Search engines could perceive the website as having been abandoned, and will remove it from their indexes.
- Two scenarios can cause broken links:
 - old link references: when sites linking to your site have not updated their links without informing your referral sites.
 - invalid link references : Erroneous link references, pages resulting in server errors
- Tools are available to identify/ handle broken links

User Behavior Patterns

- Everything you do can be used by search engines in user behavior analysis.
- **Analyzing the Search Engine Query Interface**
 - First point of contact: the search form
 - Interactions with SERPs
- **Google Analytics**
- **Google Toolbar**
- **User Behavior Lessons**

Website Performance

- Every page must load within the first four seconds; otherwise, people will start to get impatient and leave before the page loads
- Every serious website owner needs to proactively monitor his website's performance, as poor performance can have adverse web crawling and indexing effects.

Website Age

- New websites tend to exhibit more ranking fluctuations than their older counterparts.
- **Domain registration years**
 - A longer registration period :serious domain owner
 - short registrations (single-year) : suspicious.
- **Expired domains**
 - expired domains, when renewed, treated as new domains (previous pageRank will be wasted)
- **Plan for long-term benefits**
 - older domains convey authority and new pages added to these domains tend to get higher rankings more quickly.

Off –Page Optimization–Determining Top Competitors

- Understanding the competition should be a key component of planning your SEO strategy.
- Assess competitors' competence at SEO:
 - Are their websites fully indexed by Google and Yahoo!?
 - Do their product and category pages have keyword-rich page titles (title tags) that are unique to each page?
 - Do their product and category pages have reasonably high PageRank scores?
 - Is anchor text across the site, particularly in the navigation, keyword-rich?
 - Are the websites getting penalized?
 - Are they spamming the search engines with “doorway pages”?

Off –Page Optimization–Determining Top Competitors

- Uncover Competitors secrets
 - What keywords are they targeting?
 - Who's linking to their home page, or to their top-selling product pages and category pages?
 - If it is a database-driven site, what technology tricks are they using to get search engine spiders such as Googlebot to cope with the site being dynamic?
 - What effect will their future SEO initiatives have on their site traffic?
 - How does the current state of their sites' SEO compare with those of years past?

Off –Page Optimization–Accessing Historical Progress

- Measuring the results of SEO changes can be challenging because
 - many moving parts and
 - months can elapse between when changes are made to a site and when results are seen in search rankings and traffic.

Off –Page Optimization–Accessing Historical Progress

- **Maintain a Timeline of Site Changes**
- Keeping a log of changes to your site is absolutely recommended. If you're not keeping a
- Establish cause and effect, such as:
 - *If search traffic spikes or plummets*
 - *When gradual traffic changes begin*
 - *To track and report SEO progress*

Off –Page Optimization–Accessing Historical Progress

- **Types of Site Changes That Can Affect SEO**
- Adding content areas/features/options to the site
- Changing the domain of the site.
- Modifying URL structures.
- Implementing a new CMS.
- Establishing new partnerships that either send links or require them.

Off –Page Optimization–Accessing Historical Progress

- **Types of Site Changes That Can Affect SEO**
- Acquiring new links to pages on the site other than the home page.
- Making changes to navigation/menu systems
- Implementing redirects either to or from the site.
- Marketing activities that may drive upticks in usage/traffic and the source

Off –Page Optimization–Website Backlinks

- **Offpage optimization** refers to all the measures that can be taken outside of the actual website in order to improve its position in search rankings.

Off –Page Optimization–Website Backlinks

- **Link Building**
- Basically by building external links to your website, you are trying to gather as many ‘votes’ as you can, so that you can bypass your competitors and rank higher.
- The most popular ways were:
 - **Blog Directories** – something like yellow pages but each entry had a link pointing to a website.
 - **Forum Signatures** – Many people were commenting on forums for the sole purpose of getting a link back to their website

Off –Page Optimization–Website Backlinks

- The most popular ways were:
 - **Blog Directories** – something like yellow pages but each entry had a link pointing to a website.
 - **Forum Signatures** – Many people were commenting on forums for the sole purpose of getting a link back to their website
 - **Comment link** – The same concept as forum signatures where you would comment on some other website or blog in order to get a link back.
 - **Article Directories** – By publishing your articles in article directories you could get a link back to your website.

Off –Page Optimization–Website Backlinks

- The most popular ways were:
 - **Shared Content Directories** – Websites like hubpages and infobarrel allowed you to publish content and in return you could add a couple of links pointing to your websites.
 - **Link exchange schemes** – Instead of trying to publish content you could get in touch with other webmasters and exchange links.

Off –Page Optimization–Website Backlinks

- **Social Media**
- Social media is part of ‘off-site SEO’ and if you think about it, it’s also a form of link building.
- It should be noted that almost all of the links you get from social media sites are “nofollow” but this does not mean that they do not have any value.

Off –Page Optimization–Website Backlinks

- **Social Media**
- Social media is part of ‘off-site SEO’ and if you think about it, it’s also a form of link building.
- It should be noted that almost all of the links you get from social media sites are “nofollow” but this does not mean that they do not have any value.

Off –Page Optimization–Website Backlinks

- **Social Bookmarking**
- Social bookmarking is not as popular as it used to be in the past but it is still a good way to get traffic to your website.
